

Test Report — editing a saved card

PR: kuantorflow#190 + kuantorflow_automation#44 · Issues: kuantorflow#176, #186 · Date: 2026-08-03

Summary

Every content field of a saved card is now editable, under the same ownership rule as deleting, with the rename running #101's duplicate check against itself excluded. #186 rode along because it is the same code. **498 offline tests pass** (was 464) plus 4 new db-marked ones. `applog.card_edited()` finally has a call site, three weeks after it was written for this.

What changed

- ``utils.update_flashcard()`` — ownership inside the UPDATE, the duplicate check excluding the card itself, and **only the keys present in the entry** are touched, so a field the editor never rendered is left alone.
- ``utils.find_duplicate()`` — returns the blocking card *and its owner*, so the app can say whether it is even visible to this visitor (#186).
- ``POST /flashcards/<topic>/edit/<id>`` — JSON, so a refusal lands in the dialog without losing what was typed. Refuses anonymous, blocked, and not-yours; 409 on a rename collision; 404 on a missing card.
- **The pencil and dialog** in `flashcards.html`, greyed by the same rule and with the same aria-disabled treatment as #162's cross.
- ``applog.card_edited()`` / ``card_edit_denied()`` now called.
- **#186** — `duplicate_notice()` adds one sentence when the blocking card is hidden by #127's filter, on both the review popup and the automatic-add path.

Automated tests

- **Added:** `tests/test_card_editing.py` — 34 offline tests across the storage layer, the duplicate rule, ownership, the route, the log and the pencil, plus the four #186 cases.
- **Added:** `tests/test_card_editing_db.py` — 4 db-marked tests for what a fake cannot prove: `created_at` surviving an edit, examples round-tripping as lists, and the duplicate rule against the real NULL-safe comparison.
- **Suite result:** `pytest -m "not live"` — **498 passed, 10 skipped** (was 464 passed, 6 skipped).
`RUN_DB_ROUNDTRIP=1 pytest -m db` — **10 passed**.

A regression the existing suite caught

The first implementation carried every field in data- attributes on the pencil, which **leaked hidden-language translations into the page** — exactly what #46/#79/#111 forbid. Three language-visibility tests failed on the first run.

The fix changed the design for the better: `update_flashcard()` now treats a **missing** key as "leave this alone", distinct from a key holding `None` ("clear it"). The dialog renders no field for a hidden language, so it is never submitted, and the card keeps it.

Manual & browser verification

A local harness was used to sign in without a Google round trip — the app's session cookie is `HttpOnly`, so the browser cannot be handed one. It sets that one flag and adds a login route, lives in a scratch file, and touches nothing in the repository. A probe account with one owned card and one unowned card was created on a throwaway topic and removed afterwards.

- **The pencil:** active on the owned card, greyed on the other with *"This card was created by admin or another user. You cannot edit the card."*
- **The dialog** opened pre-filled with all eight fields; examples shown one per line.
- **A real edit** (word, explanation, examples) → `resilient` → `resilient-edited`, explanation replaced, examples stored as a two-item array. ``translation_ukr` untouched. `created_at` unmoved` (same second as its unedited sibling). Log: `EDIT word=resilient-edited pos=adjective id=100 changed=word,explanation_en,examples_en source='card page'`.
- **A colliding rename** → dialog stayed open, typed value kept, Save re-enabled, message *"Another card for 'somebodyelse' (noun) already exists, so this one cannot be renamed to it."* Database unchanged.
- **A hand-made POST** for the card the visitor does not own → **403**, the not-yours message, an `EDIT-DENIED ... reason='not owner'` line, no change.
- **#186** — with the filter on, adding a word whose only card is hidden returned note: *"It is in the shared deck, hidden from you by your 'Use only individual cards' setting."*
- **Cleanup:** probe cards, probe user, `settings/config-14.json` and both temporary launch configs removed; the database afterwards holds only the real account.

Result

Pass, against every acceptance criterion in #176, and #186's recommended option (better message, no change to what is stored).

Worth noting:

- **The dialog was driven from the page's own script** rather than by clicking each field, after element references went stale mid-interaction twice. The clicks it performs are the page's real handlers, and the results were verified in the database and the log rather than on screen.
- ``created_at`` **was checked against real MySQL**, not asserted from a fake: the risk was MySQL's implicit `ON UPDATE CURRENT_TIMESTAMP` on a first timestamp column, which no stub would ever reproduce.
- **Editing a card's topic is out of scope** and remains #177.
