

Test Report — Action logs (cards, dictionaries, parsed files)

PR: kuantorflow#155 (+ kuantorflow_automation#25) · Issue: kuantorflow#30 · Date: 2026-07-27

Summary

A new `applog.py` writes a plain-text action trail into `logs/`: `cards.log`, `dict.log` and `parsed_files.log`, rotating every 30 days. Every logged action was driven against the running app and the resulting lines inspected; 19 new offline tests cover the wiring. Suite: **150 passed**, was 131.

What changed

- **`applog.py` (new)** — three rotating loggers behind small named helpers (`card_created`, `card_skipped`, `card_edited`, `card_deleted`, `card_delete_missed`, `lookup_started`, `translations_fetched`, `definitions_fetched`, `lookup_finished`, `lookup_failed`, `file_parsed`, `file_rejected`, `terms_split`) plus a `Timer` for the `ms=` fields.
- Line format `<timestamp> ACTION key=value ...`; values containing spaces are quoted, so `grep "word=brittle" logs/*.log` works.
- `TimedRotatingFileHandler` (`when="midnight"`, `interval=30`, `backupCount=12`) — Python has no calendar-month unit, so a month is 30 days; a year of rotations is kept.
- **Every helper swallows its own errors** — a full or read-only disk costs a log line, never a saved card.
- `KF_LOGS_DIR` redirects the directory; resolution is lazy, so the test suite can point it at a temp dir per test.
- **`app.py`** — `_save_and_log()` is the one place cards are saved and logged; all three save paths (review popup, automatic add, Mykola chat) go through it, each with its own `source=`. Deletes (hit and miss) log from the delete route. Uploads log `PARSE / REJECT` with the file, its size and the card count. The lookup route logs the `LOOKUP` line, which carries the identity the parser cannot see.
- **`parsers.py`** — `lookup_word()` logs each provider it actually called (`TRANSLATE / DEFINE`), with elapsed `ms`, error, and `fallback_from=` when a silent fallback kicked in; `_provider_name()` names the site from the backend function, so an unknown setting is logged as the provider that really ran. `_split_glued_translations()` logs the AI split, which fails silently by design.
- **`.gitignore`** — `logs/*` with `!logs/.gitkeep` (the global `*.log` rule does not cover dated rotations like `cards.log.2026-08-26`).
- **README / CLAUDE.md** — the log files, the line format, rotation, and the convention that a new save/delete path must log.

Automated tests

- **Added:** tests/test_action_logs.py — 19 tests: each card action and its source, anonymous vs signed-in attribution, duplicate → SKIP, delete hit and miss, the dict lines for a normal lookup and for a Bing→Google + Oxford→Reverso fallback, a failed lookup, upload PARSE/REJECT, the AI split, the three file names, the rotation settings (when, 30-day interval, 12 backups), value quoting, propagate is False, and that a logger raising OSError still leaves the card saved and the response 200.
- **Updated:** conftest.py — autouse action_logs fixture redirecting applog.LOGS_DIR to tmp_path, so no test writes into a real checkout.
- **Suite result:** pytest -m "not live" — **150 passed**, 1 skipped, 6 deselected (was 131). Run twice, with and without test-order randomisation.

Manual & browser verification

Dev server against local MySQL, driving every logged action in one pass, then reading the three files:

Action	Line written
Look up brittle (real providers)	LOOKUP ... translator=google dictionary=oxford user=anonymous, TRANSLATE ... provider=google lang=uk pos_count=1 ms=107, same for ru, DEFINE ... provider=oxford pos_count=1 ms=1346, RESULT ... cards=2 ms=1582
Add a reviewed card	CREATE word=brittle pos=adjective topic=probe30 id=68 langs=ukr source='review popup' user=anonymous
Add the same card again	SKIP ... reason=duplicate
Upload LucidDream.txt	PARSE file=LucidDream.txt bytes=403 cards=1 topic=probe30 ms=0 user=anonymous
Upload scan.pdf	REJECT file=scan.pdf error='Unsupported notes format: .pdf'
Delete the card	DELETE id=68 word=brittle topic=probe30 source='topic page'
Delete a missing id	DELETE-MISS id=999999

Test rows were removed from the local DB (back to 47) and the probe log files deleted; git check-ignore confirms both logs/cards.log and logs/cards.log.2026-08-26 are ignored while logs/.gitkeep is tracked.

Result

Pass, with one gap called out rather than invented: the app has **no edit-a-saved-card feature**, so the issue's "editing a card" has nothing to hook into. applog.card_edited() is implemented and tested so that an edit feature logs from its first commit — the only item of the issue not wired to a live call site.
